Art Unit: 3726

1. Applicant's election without traverse of Groups I and II, claims 1-24 in Paper No. 7 is acknowledged.

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 21 and 24 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by St. Clair (5,444,905).

4. Claim 24 is rejected under 35 U.S.C. 102(b) as being clearly anticipated by Stumpf (4,439,977). Stumpf teaches the structure of the finished article, i.e. an encapsulated spring. The patentability of a product-by-process claim is determined by the structure of the finished article. Process limitations are given weight only to the extent that they require structure in the finished article. See In re Thorpe, 227 USPQ 964, (CAFC 1985).

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 1-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stumpf in view of Takase (4,112,721). Stumpf teaches the claimed subject matter

Art Unit: 3726

except for programmable control means operably linked to coiling elements to control their positions and the shape of welding horns. Takase teaches that numerical control means to control a coiling process was known. It would have been obvious to one of ordinary skill in the art to modify the apparatus and process of Stumpf to employ a programmable controller to provide automatic control and adjustment in view of Takase's teaching that the process and apparatus were known for automatic control of a coiling process. The structure of the welding horns is considered to have been a matter of ^{design} article and obvious in the absence of disclosure of the structure of the welding horn causing new or unexpected results or of it solving a stated problem.
